

OVERVIEW

The assignment was divided into five tasks, each focused on a specific category of Excel functionality:

1. Sum, Count, and Average: Calculating the total price of all products, the total number of products, and the average product price.
2. Minimum and Maximum: Identifying the lowest and highest priced products in the dataset.
3. Conditional Classification (IF Function): Creating a new column to classify each product as "High Price" or "Standard Price" based on a defined price threshold.
4. Conditional Aggregation (SUMIF and COUNTIF): Calculating the total price of products within a specific category, and counting the number of products below a given price point.
5. Text Extraction (LEFT, RIGHT, MID): Deriving three new columns (Day, Country Code, and Month) from the Product ID field using positional text functions.
